

CENTRE DE SIMULATION ET D'EXPERTISE MARITIME
MARITIME SIMULATION AND RESOURCE CENTRE

Designing a Simulation Area for Navigation Purposes

by
Alexandre Paradis

MARITIME SIMULATION AND RESOURCE CENTRE

About the MSRC:

- Founded in 2005
- Owned and operated by working marine pilots
- Four fully-instrumented navigation bridges
- Equipped with Kongsberg Digital's Maritime Simulation System
- Capability to operate simultaneous interactive scenarios including all four bridges
- In-house capabilities to build "pilot grade" ship models and customized geographic databases
- Vast portfolio of over 100 ship models and 30 databases

Clients and Partners:

- Pilot associations
- Port administrations
- Shipowners
- Government
- Stevedoring companies
- Engineering companies

AREA DATABASE FOR MARITIME SIMULATION PURPOSES

DATABASE COMPONENTS AND LAYERS

Layers in an area database:

- Visual layer
- Radar file
- Bathymetry file
- Instructor map
- Buoys and objects
- Tides and currents
- Environmental data (wind, rain, etc.)

Divided into 2 parts:

- Management files
- Visual files

DATABASE MANAGEMENT FILES

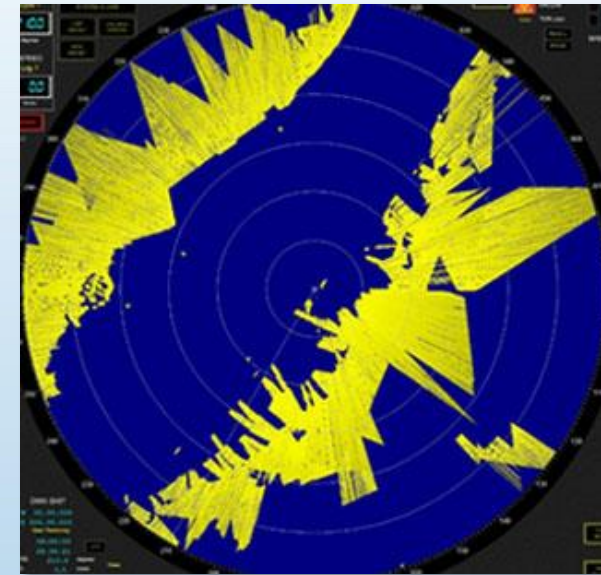

Instructor file

Currents and tides file

Radar file

Bathymetry file

Ultramar/Valero,
St-Romuald

DATABASE VISUAL FILES

Modeling

K-Sim simulation

Polaris simulation

Ultramar/Valero,
St-Romuald

DATABASE MANAGEMENT FILES

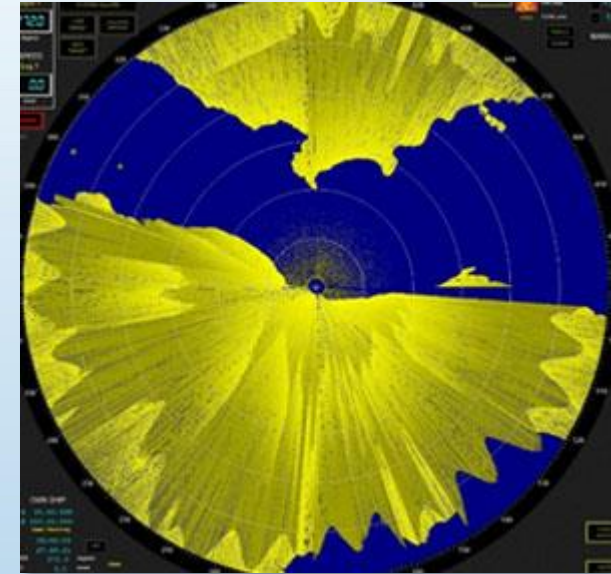

Instructor file

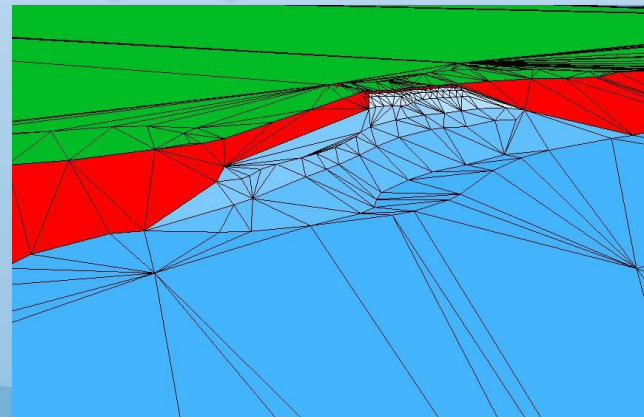

Currents and tides file

Radar file

Bathymetry file

Maritime Terminal,
Grande-Anse

DATABASE VISUAL FILES

Modeling

Simulation

Simulation: under water view

Maritime Terminal,
Grande-Anse

BUILDING AN AREA DATABASE

DESIGN PHASES

- Specifying the boundaries for the area
- Gathering all the information
- Setting up the project
- Management files
- Visual files
- Objects in the exercise area
- Deploying the database
- Updating the database

SPECIFYING THE BOUNDARIES FOR THE AREA

- Boundaries
- Origin of the database
- Navigation route
- Level of detail

GATHERING ALL THE INFORMATION

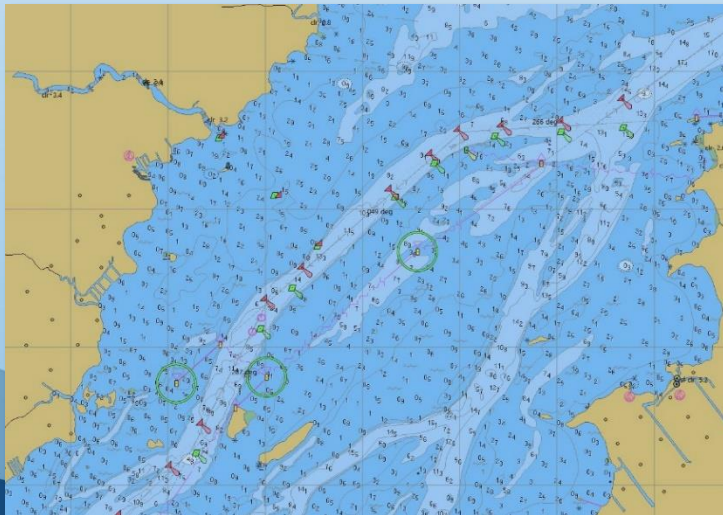

- Electronic navigation charts
- Height map source
- Bathymetric surveys
- LiDAR surveys
- Engineering plans

Dredging Plan, Rimouski

ENC, Saint Lawrence Seaway

Height Map, Georgian Bay

SETTING UP THE PROJECT

- Coast and tide simplification
- River shift
- Terrain texturing
- IALA region

Source : Kongsberg Digital Simulation, 2017

Editing K-DAG outputs:

- Ports and docks (future facilities)
- Radar file
- Buoys
- Instructor file
- Bathymetric data

Connection between meshes

Raster vectorization

Data integration

IMPORTANCE OF THE DATA

- Bathymetry's influence on the ship's movements
- Precision of the tides and currents greatly impact navigation

Multibeam echo sounder's data

Marine Chart Data – Dredged Channel Display

VISUAL FILES

Populate the visual files:

- Visual landmarks
- Buoys and NAVAIDS
- Ports and docks equipment
- Buildings and vegetation

EXERCISE AREA OBJECTS (EAO)

Allows interaction between ships and the database:

- Collision with the docks
- Mooring ships to a dock
- Lock gates and drawbridges in channels

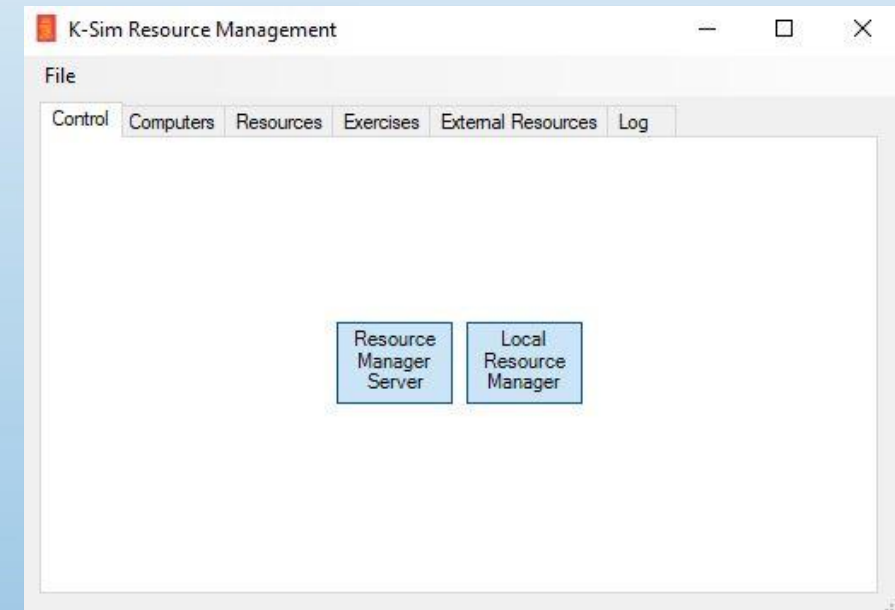

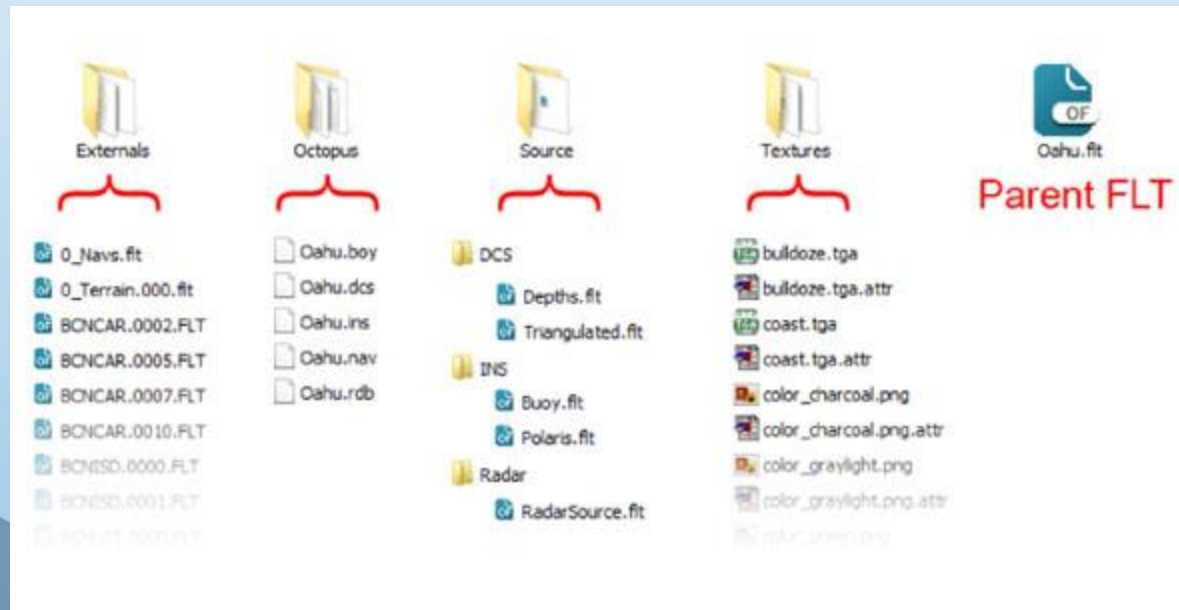

DEPLOYING THE DATABASE

Two software, two ways to deploy a database:

- Polaris -> Copy and disperse files manually to all computers
- K-Sim -> Deploy and place the database on a server manager

Source : Kongsberg Digital Simulation, 2017

UPDATING THE DATABASE

- Add new buildings
- Add or change NAVAIDS
- Configure new docks
- Make changes to the bathymetry

Source : Google Earth Pro (06/2019)

New Keating Channel in Toronto

The background image is a composite of several elements. At the top, there are three large monitors showing a 3D perspective view of a harbor or port area with buildings and water. Below these, there are several smaller monitors and a laptop. One monitor shows a green radar-like display, and the laptop shows a map with various data points and a scale. In the foreground, a large, curved table holds a detailed nautical chart or map. The overall scene is dimly lit, suggesting an indoor environment like a bridge or control room.

Navigating Inside an Area Database

ENVIRONMENTAL DATA

- Waves
- Wind
- Currents
- Tides
- Ice
- Fog and rain

CURRENTS AND TIDES FILES

- Issued from surveys and observations
- Varying over a period of time
- Can be created/edited manually
- Conversion to K-Sim -> Set the 0 to the local Main Sea Level

TIDES

VARIOUS SIMULATION PURPOSES

- Teaching and training vessel manoeuvres in specific ports and environmental conditions
- Engineering projects for ports
- Investigating accidents

SIMULATOR EXPERIENCE:

Enables participants to:

- Manoeuvre in geographical areas using real vessel equipment
- Interact with other vessels (up to 300 per exercise)
- Navigate in conditions affecting ship handling, such as currents, tides, wind, bank effect, squat, etc.
- Perform complex manoeuvres with or without tugs

Expertise:

- Database design (existing or planned)
- Ship model design
- Validating the operational feasibility of a port project
- Creating realistic conditions, designing or modifying database elements
- Accelerated-time simulation
- Real-time simulation
- Reports and data for port development projects
- Investigating accidents
- Audio-visuals

Thank you
